**Antiseizure Medications** May 16 2021 "Approximately 10% of the general population will experience at least one seizure within their lifetimes in most Western countries, and even higher rates are observed in developing countries. However, not all individuals go on to develop epilepsy, which is characterized by recurring epileptic seizures. The prevalence of epilepsy is 7.1 cases per 1,000 people (range 4.0 to 8.9) and its incidence is 47.4 cases per 100,000 people per year worldwide (Kotsopoulos et al., 2002; Hirtz et al., 2007). An epileptic seizure is the transient occurrence of signs or symptoms due to abnormal excessive, hypersynchronous firing of neurons in the brain. The practical clinical definition of epilepsy proposed by the International League Against Epilepsy (ILAE) considers epilepsy to be a disease of the brain defined by any of the

following conditions: (1) at least two unprovoked (or reflex) seizures occurring >24 hours apart; (2) one unprovoked (or reflex) seizure and a probability of further seizures similar to the general recurrence risk after two unprovoked seizures (at least 60%), occurring over the next 10 years; and (3) diagnosis of an epilepsy syndrome (Fisher et al., 2014). Epilepsy may be due to genetic causes (possessing an inherited trait to have seizures), brain tumors, infections (meningitis or encephalitis), brain trauma, stroke, developmental anomalies (eg, cortical dysplasia), brain malformations (tuberous sclerosis, neurofibromatosis), vascular malformations (arteriovenous malformations), and other causes"--

**Orbital Mechanics for Engineering Students** Jan 30 2020 Orbital Mechanics for Engineering Students, Second Edition, provides an introduction to the basic concepts of space mechanics. These include vector kinematics in three dimensions; Newton's laws of motion and gravitation; relative motion; the vector-based solution of the classical two-body problem; derivation of Kepler's equations; orbits in three dimensions; preliminary orbit determination; and orbital maneuvers. The book also covers relative motion and the two-impulse rendezvous problem; interplanetary mission design using patched conics; rigid-body dynamics used to characterize the attitude of a space vehicle; satellite attitude dynamics; and the characteristics and design of multi-stage launch vehicles. Each chapter begins with an outline of key concepts and concludes with problems that are based on the material covered. This text is written for undergraduates who are studying orbital mechanics for the first time and have completed courses in physics, dynamics, and mathematics, including differential equations and applied linear algebra. Graduate students, researchers, and experienced practitioners will also find useful review materials in the book. NEW: Reorganized and improved discussions of coordinate systems, new discussion on perturbations and quaternions NEW: Increased coverage of attitude dynamics, including new Matlab algorithms and examples in chapter 10 New examples and homework problems
