science writer for kids Gail Gibbons, this updated edition brings the latest astronomy facts to young readers. After the sun sets, on clear nights points of light begin to appear in the sky. But when we look up at the night sky, what are we seeing? Vetted by an expert, this new and updated edition introduces scientific facts about the stars, as well as how we look at and learn about them, through simple text and bold illustrations. From ancient names for constellations to modern innovations in telescope technology, this book covers a broad range of ideas without overwhelming the reader. It introduces and reinforces important vocabulary for the aspiring astronomer, explaining everything in clear, simple phrases. Nonfiction master Gail Gibbons "has taught more preschoolers and early readers about the world than any other children's writer-illustrator" according to The Washington Post. This book includes a brief timeline of major advances in astronomy, written in concise, kid-friendly language, and a wealth of fun facts and trivia about the stars. The sociology of fame and celebrity is at the cutting edge of current scholarship in a number of different areas of study. Stargazing highlights the interactional dynamics of celebrity and fame in

contemporary society, including the thoughts and feelings of stars on the red carpet, the thrills and risks of encountering a famous person at a convention or on the streets, and the excitement generated even by the obvious fakery of celebrity impersonators. Using compelling, real-life examples involving popular celebrities, Ferris and Harris examine how the experience and meanings of celebrity are shaped by social norms, interactional negotiations, and interpretive storytelling. Discover the wonders of the Universe with this complete introduction to observing and understanding the night sky. This practical guide explains and demystifies stargazing, teaching you to recognize different kinds of objects and showing you how they move through the sky over the course of the night and the year. It shows you how to understand and enjoy the cosmos, building your practical astronomy skills from the basics to more advanced techniques. Beginning with an explanation of the Universe itself - how big is it, what shape is it, how old is it, and will it end? - it then takes you on a tour around the night sky, building up your knowledge in simple stages. Practical advice begins with naked-eye observations, then illustrated step-by-step instructions show

you how to set up and use binoculars and telescopes, and how to take your own pictures of the night sky. It also lets you take a closer look at the different objects you can view in the night sky, telling you how to train your eye to recognize basic patterns of stars (constellations) and how to tell planets apart from other celestial bodies, showing you how to observe them in an innovative step-by-step way. An atlas of the night sky is also included, with charts that can be used in both the northern and southern hemispheres throughout the year.

Accessible, inspirational, and authoritative, *Stargazing for Beginners* will enthuse and inform anyone who wants to expand their knowledge of the night sky. Looking at the sky, for children, picture book. The very first work of its kind, *Celebrating the Universe!* is a tour of the wonders of the heavens, with a focus on the "soul" of the night sky.

Astronomer and author James Mullaney has written this travel guide to the stars from a metaphysical and spiritual perspective in addition to a scientific one. The unique unifying theme throughout is the personal benefits of communing with these marvels firsthand—the joy and heady excitement of participating in the great cosmic drama unfolding nightly overhead. Everything the budding stargazer and celestial pilgrim needs for this journey is contained within this volume, from how to observe the sky (with the unaided eye and binoculars) . . . to what to

see—and why! This book covers: • The Sun, the Moon, and all of the planets • Comets, asteroids, meteors, and artificial satellites • Variable and exploding stars, colorful double and multiple stars, and glittering star clusters • Eerie glowing nebulae, our majestic Milky Way, and remote galaxies Through exercises and reflections, you'll also learn about little-known aspects of stargazing such as therapeutic relaxation, celestial meditation, expansion of consciousness, spiritual contact, and astral travel; and you'll explore profound concepts such as our heritage as children of the stars (we are made of stardust!) and our cosmic destiny as citizens of the universe. *Night Sky Notebook* 8"X10" inches 110 prompted fill in pages Cute Matte Cover Happy observing! There are several approaches to recording observations in the night sky ranging from naked eye observations and interpretations to highly scientific observations using instruments. *Night Sky Journal* is great for beginning astronomers, and assumes only that the user has access to a telescope. There is space for to sketch observations using both low and high power in their telescopes. (Low power can give more of an overview of a celestial object while higher power can zoom you in for more detail). Lots of space to jot the basic settings of their telescope and make notes about what they observed. Great for children, teamed with learning how to use a telescope and being outdoors can sketch

what objects they saw in the sky, space to chart out stars they spotted, or to write down how watching the sky made them feel. For more seasoned astronomers and astrologers, sky notes could more focus on astrological movements and their meanings. Consider adding *Night Sky Journal* to your learning shelf. If you have knowledge of the subject, think about issuing a challenge to your kids or student class to observe particular objects in the sky over a period of time or even integrate these pages with a learning worksheet that highlights special events in the night sky - eclipses, passing comets and so on.... Makes A Great Gift Under 10 For: Students Teachers Kids Moms Homeschooling Classrooms Future Astronomers stocking stuffers Birthday Space Themed Birthday Parties In a historical investigation of the pleasures of cinema, *Star Gazing* puts female spectators back into theories of spectatorship. Combining film theory with a rich body of ethnographic research, Jackie Stacey investigates how female spectators understood Hollywood stars in the 1940's and 1950's. Her study challenges the universalism of psychoanalytic theories of female spectatorship which have dominated the feminist agenda within film studies for over two decades. Drawing on letters and questionnaires from over three hundred keen cinema-goers, Stacey investigates the significance of certain Hollywood stars in women's memories of wartime and postwar Britain. Three key

processes of spectatorship - escapism, identification and consumption - are explored in detail in terms of their multiple and changing meanings for female spectators at this time. Star Gazing demonstrates the importance of cultural and national location for the meanings of female spectatorship, giving a new direction to questions of popular culture and female desire. This new edition of Philip's Stargazing with a Telescope has been fully revised and updated to include the latest telescopes and accessories on the market. imminent, a group of well-known Jewish scientists and artists sidestepped despair by challenging themselves to solve some of the most difficult questions posed by our age. Many had just fled Europe. Others were born in the United States to immigrants who had escaped Russia's pogroms. Alternately celebrated as mavericks and dismissed as eccentrics, they trespassed the boundaries of their own disciplines as the entrance to nations slammed shut behind them. In *Stargazing in the Atomic Age*, Anne Goldman interweaves personal and intellectual history in exuberant essays that cast new light on these figures and their virtuosic thinking. In lyric, lucent sentences that dance between biography and memoir as they connect innovation in science with achievement in the arts, Goldman yokes the central dramas of the modern age with the brilliant thinking of earlier eras. Here, Einstein plays Mozart to align mathematical principle with the music of the spheres and Rothko paints canvases whose tonalities echo the stark prose of Genesis. Nearby, Bellow evokes the dirt and dazzle of the Chicago streets, while upon the heels of World War II, Chagall illuminates stained glass no less buoyant than the effervescent notes of Gershwin's *Rhapsody in Blue*. In these essays, Goldman reminds readers that Jewish history offers as many illustrations of accomplishment as of affliction. At the same time, she gestures toward the ways in which experiments in

science and art that defy partisanship can offer us inspiration during a newly divisive era. An amateur astronomer documents a year spent observing the night sky and building an observatory in his New England backyard, offering additional background information on the history of armchair astronomy and how it has assisted the scientific community. This special edition has been designed specifically for aspiring astronomers living south of the equator. This book explores the planets, stars, galaxies and nebulae observable from the southern hemisphere. Not only does this book illustrate how to observe, it also shows how each object appears through a small telescope! Moon is everything Christine isn't. She's confident, impulsive, artistic . . . and though they both grew up in the same Chinese-American suburb, Moon is somehow unlike anyone Christine has ever known. But after Moon moves in next door, these unlikely friends are soon best friends, sharing their favorite music videos and painting their toenails when Christine's strict parents aren't around. Moon even tells Christine her deepest secret: that she has visions, sometimes, of celestial beings who speak to her from the stars. Who reassure her that earth isn't where she really belongs. Moon's visions have an all-too-earthly root, however, and soon Christine's best friend is in the hospital, fighting for her life. Can Christine be the friend Moon needs, now, when the sky is falling? A first-time skywatcher's guide from bright new talent, BBC Blue Peter astronomer, Anton Vamplew The story of the people who see beyond the stars—an astronomy book for adults still spellbound by the night sky. Humans from the earliest civilizations through today have

craned their necks each night, using the stars to orient themselves in the large, strange world around them. Stargazing is a pursuit that continues to fascinate us: from Copernicus to Carl Sagan, astronomers throughout history have spent their lives trying to answer the biggest questions in the universe. Now, award-winning astronomer Emily Levesque shares the stories of modern-day stargazers in this new nonfiction release, the people willing to adventure across high mountaintops and to some of the most remote corners of the planet, all in the name of science. From the lonely quiet of midnight stargazing to tall tales of wild bears loose in the observatory, The Last Stargazers is a love letter to astronomy and an affirmation of the crucial role that humans can and must play in the future of scientific discovery. In this sweeping work of narrative science, Levesque shows how astronomers in this scrappy and evolving field are going beyond the machines to infuse creativity and passion into the stars and space and inspires us all to peer skyward in pursuit of the universe's secrets. Hill was nineteen, it was 1973 and, with his head fed by Vietnam, Zappa, Kerouac, Vonnegut, Watergate and Coronation Street, he spent six months on various lighthouses, "keeping" with all manner of unusual and fascinating people. Within thirty years this way of life was to have disappeared entirely. The resulting book is a charming and beautifully written memoir that is not only a heartfelt lament for Hill's own youth and innocence but also for a simpler and more honest age. Searching more for a learned appreciation of nature and our exact place within the cosmos than academic scientific

knowledge, science and travel writer Jamie Carter takes the reader on a 12 month tour of the night sky's incredible annual rhythms that say so much about Earth. During the journey he learns about the celestial mechanics at work in the skies above that are - to the beginner - almost beyond belief. As well as the vital

constellations and clusters, and the weird and wonderful nebulas, he searches out "dark sky destinations" across the globe that help increase knowledge and give a new perspective on familiar night sky sights. On the journey he witnesses a solar eclipse and grapples with star-charts, binoculars, smartphone apps, telescopes, spots satellites and

attempts basic astro-photography. By year's end, the reader will be able to glance at the night sky from anywhere on the planet and tell what direction he or she is facing, what time it is, where all the planets are and even where the Galactic Center Point is.
